Docket JCK-LEV-1

**USE OF LEVETIRACETAM
FOR TREATING OR PREVENTING ACUTE HEADACHES**

ABSTRACT OF THE DISCLOSURE

Levetiracetam, an N-type calcium channel antagonist drug, has been discovered to be highly effective in treating migraine headaches. When administered orally on a daily basis, it reduces the adverse traits (including frequency, severity, and duration) of migraines among chronic sufferers. When injected intravenously, it was highly effective in entirely curing or greatly reducing full-blown acute migraine headaches, even among patients who could not be treated adequately by triptans or any other known drugs.
